Chapter 1

1.1 Warm up 1

Question 1

Suppose we are excavating a hole that is 10ft long, 6ft wide, and 4ft deep. If the soil weighs 12 lb/ft³, what is the total weight of soil removed

Solution: There is a uniform density

$$\text{volume: } (4)(6)(10) = 240\text{ft}^3$$

$$\text{weight: } (12\text{lb/ft}^3)(240\text{ft}^3) = 2880\text{lbs}$$

Question 2

Suppose instead the hole is 6ft long, 4ft wide, and 10 ft deep. Which hole takes more energy to dig?

Solution: more energy for (2) since we need to lift the soil out of the hole

1.2 In class notes

Note:-

In physics work = (force)(distance)

$$(\text{ft} * \text{lbs}) = (\text{lbs})(\text{ft})$$

$$(\text{N} * \text{m}) = (\text{n})(\text{M})$$

Example 1.2.1 (Q: For (2), how much work is required to remove the soil)

Slice the shape into layers parallel to the bottom of the hole.

Let x be the depth from the top of the hole ($0 \leq x \leq 10$) each layer has thickness Δx .

$$\text{Volume of the } i^{\text{th}} \text{ slice} = (4)(6)(\Delta x) = 24\Delta x \text{ ft}^3$$

$$\text{Weight of the } i^{\text{th}} \text{ slice} = 12\text{lb/ft}^3(24\Delta x)\text{ft}^3 = 288\Delta x \text{ lbs}$$

$$\text{Work need to lift } i^{\text{th}} \approx (288\Delta x \text{ lbs})(x_i\text{ft})$$

It is approximate and not exact because no all of the i^{th} slice is lifted the same distance

$$\text{Total work} \approx \sum_{i=1}^n 288x_i\Delta x(\text{ft} * \text{lbs})$$

$$\int_0^{10} 288x dx \text{ ft} * \text{lbs} = (144x^2) \Big|_0^{10} = 14400 \text{ ft} * \text{lbs}$$

Example 1.2.2 (Q: How much work for a 10 by 6 by 4 hole)

$$\text{Volume of the } i^{\text{th}} \text{ slice} = (10)(6)(\Delta x) = 60\Delta x \text{ ft}^3$$

$$\text{Weight of the } i^{\text{th}} \text{ slice} = 12\text{lb/ft}^3(60\Delta x)\text{ft}^3 = 720\Delta x \text{ lbs}$$

Work need to lift $i^{\text{th}} \approx (720\Delta x \text{ lbs})(x_i \text{ ft})$

It is approximate and not exact because no all of the i^{th} slice is lifted the same distance

Total work $\approx \sum_{i=1}^n 720x_i \Delta x (\text{ft} * \text{lbs})$

$$\int_0^4 720x dx \text{ ft} * \text{lbs} = (360x^2) \Big|_0^4 = 5120 \text{ ft} * \text{lbs}$$

Example 1.2.3 (Suppose the density of the soil is given by $p(x) = 8 + 2x \text{ lb/ft}^3$. How does the change the answer for the shallow soil?)

Volume of the i^{th} slice $= 60\Delta x \text{ ft}^3$

Weight of the i^{th} slice $= (8 + 2x_i)60\Delta x$

Work needed to lift the i^{th} slice $\approx (8 + 2x + i)(60\Delta x)(x_i)$

Total work $\approx \sum_{i=1}^n (8 + 2x_i)(60x_i)\Delta x$

$$\int_0^4 (8 + 2x_i)(60x) dx$$

Example 1.2.4 (Circular corn field of radius 50 ft. The density of the corn in (ears/ft²) is a function $f(y)$ where y is the distance from the center of the circle. Write an intergral to compute the total yield in ears)

$$\text{area of } i^{\text{th}} \text{ slice} = \pi y_i^2 - \pi(y_i - \Delta y)^2$$

$$= \pi y_i^2 - \pi(y_i^2 - 2y_i \Delta y + (\Delta y)^2)$$

$$\approx 2\pi y_i \Delta y$$

$$\text{ears in the } i^{\text{th}} \text{ slice} = p(y_i)2\pi y_i \Delta y$$

$$\text{total number of ears} \approx \sum_{i=1}^n p(y_i)2\pi y_i \Delta y$$

$$\text{total number of ears} = \int_0^{50} f(y)2\pi y \Delta y$$

Chapter 2

2.1 Warm up

Question 3

Suppose the circular corn field instead has an irrigation ditch running along a diameter. As before the density of corn is a function of the distance from the water source. How must you slice up the region so that the density is (approx) constant in each slice?

Solution: You must slice parallel to the water source so it should be sliced vertically.

Question 4

If the density (in ears/ft²) is given by the function g , write an integral to compute the total number of ears in the field

Solution:

$$\left(\frac{l_i}{2}\right)^2 + y_i = 50^2$$

$$\frac{l_i^2}{4} = 2500 - y_i^2$$

$$l_i = \sqrt{10000 - 4y_i^2}$$

number of ears in i^{th} slice $\approx g(y_i)\sqrt{10000 - 4y_i^2}\Delta y$

total number of ears $\approx 2 \sum_{i=1}^n g(y_i)\sqrt{10000 - 4y_i^2}\Delta y$

total number of ears $= 2 \int_0^{50} g(y_i)\sqrt{10000 - 4y_i^2}dy$

Example 2.1.1 (Conical tank full of sludge with density $f(z)$ kg/m³, where z is depth. Find an integral to compute the work done (against gravity) in pumping all the sludge to height p 1 m above the tank)

Volume of the i^{th} slice $\approx \pi r_i^2 \Delta z$

$$\frac{r_i}{6-z_i} = \frac{3}{6}$$

$$r_i = \frac{1}{2}(6 - z_i) = 3 - \frac{z_i}{2}$$

Volume of the i^{th} slice $\pi \left(3 - \frac{z_i}{2}\right)^2 \Delta z$ m³

mass of the i^{th} slice $\approx f(z_i)\pi \left(3 - \frac{z_i}{2}\right)^2 \Delta z$ kg

weight of the i^{th} slice $\approx 9.8f(z_i)\pi \left(3 - \frac{z_i}{2}\right)^2 \Delta z$ N

work for the i^{th} slice $\approx 9.8f(z_i)\pi \left(3 - \frac{z_i}{2}\right)^2 \Delta z(z_i + 1)$ J

$$\begin{aligned}\text{total work} &= \sum_{i=1}^n 9.8f(z_i)\pi\left(3 - \frac{z_i}{2}\right)^2(z_i + 1)\Delta z \text{ J} \\ \text{total work} &= \int_0^6 9.8f(z)\pi\left(3 - \frac{z}{2}\right)^2(z + 1)dz \text{ J}\end{aligned}$$

Example 2.1.2 (Given a function $f(x)$, $a \leq x \leq b$ what is the length of the graph)

$$\begin{aligned}\text{length of } i^{\text{th}} \text{ piece} &\approx \sqrt{(x_i - x_{i-1})^2 + (f(x_i) - f(x_{i-1}))^2} \approx \sqrt{(\Delta x + (f'(x_i))\Delta x)^2} = \sqrt{1 + (f'(x_i))^2}\Delta x \\ \text{total length} &= \sum_{i=1}^n \sqrt{1 + (f'(x_i))^2}\Delta x \\ \text{total length} &= \int_a^b \sqrt{1 + (f'(x))^2}dx\end{aligned}$$

Chapter 3

3.1 Warm up

Question 5

Find the tangent line to $f(x) = \frac{1}{1+x^2}$ at $x = 2$

Solution:

$$f'(x) = \frac{0 \cdot (1+x^2) - 1(2x)}{(1+x^2)^2} = \frac{-2x}{(1+x^2)^2}$$

$$f'(2) = \frac{-2(2)}{(1+2^2)^2} = \frac{-2}{5^2} = \frac{-2}{25}$$

$$f(2) = \frac{1}{5}$$

$$y - \frac{1}{5} = -\frac{2}{25}(x - 2)$$

$$y = \frac{1}{5} - \frac{4}{25}(x - 2)$$

Question 6

If we use this line to approximate f near $x = 2$, will we get an overestimate or an underestimate?

Solution:

$$f''(x) = \frac{-2(1+x^2)^2 - (-2x)2(1+x^2)(2x)}{(1+x^2)^4}$$

$$f''(x) = \frac{-2 - 2x^2 + 8x^2}{(1+x^2)^3}$$

$$f''(x) = \frac{6x^2 - 2}{(1+x^2)^3}$$

$$f''(x) = 0$$

$$0 = 6x^2 - 2$$

$$x = \pm \sqrt{\frac{1}{3}}$$

$L(x)$ underestimates $f(x)$ near $x = 2$

Example 3.1.1 (Find the quadratic function that best approximates $f(x) = \frac{1}{1+x^2}$ near $x = 2$)

Find $Q(x) = C_0 + C_1(x - 2) + C_2(x - 2)^2$ such that $Q(2) = f(2) = \frac{1}{5}$, $Q'(2) = f'(2) = \frac{-4}{25}$, and $Q''(2) = f''(2) = \frac{22}{125}$

$$Q'(x) = C_1 + 2C_2(x - 2)$$

$$Q''(x) = 2C_2$$

$$Q(2) = C_0 = \frac{1}{5}$$

$$Q'(2) = C_1 = \frac{-4}{25}$$

$$Q''(2) = 2C_2 = \frac{22}{125} \rightarrow C_2 = \frac{11}{125}$$

$$Q(x) = \frac{1}{5} - \frac{4}{25}(x - 2) + \frac{11}{125}(x - 2)^2$$

Note:-

General formula: $Q(x) = f(a) + f'(a)(x - a) + \frac{f''(a)}{2}(x - a)^2$

Def: The n^{th} degree Taylor polynomial of $f(x)$ based at $x = a$ is:

$$P_n(x) = f(a) + f'(a)(x - a) + \frac{f''(a)}{2}(x - a)^2 + \frac{f^{(3)}(a)}{6}(x - a)^3 + \frac{f^{(4)}(a)}{24}(x - a)^4 + \dots + \frac{f^{(n)}(a)}{n!}(x - a)^n$$

$\sum_{k=0}^n \frac{f^{(k)}(a)}{k!}(x - a)^k$ Define:

$$f^{(0)}(x) = f(x) \quad 0! = 1$$

$$(x - a)^0 = 1 \text{ for all } x$$

Example 3.1.2 (Let $f(x) = \frac{1}{1-x}$, based at $x = 0$. Find $P_4(x)$)

$$f(x) = \frac{1}{1-x}$$

$$f'(x) = \frac{-1}{(1-x)^2}(-1) = \frac{1}{(1-x)^2}$$

$$f''(x) = \frac{2}{(1-x)^3}$$

$$f^{(3)}(x) = \frac{6}{(1-x)^4}$$

$$f^{(4)}(x) = \frac{24}{(1-x)^5}$$

Chapter 4

4.1 Warm Up

Question 7

Suppose for a certain function f we know that $|f'(x)| \leq f$ for all x .

- (1) What is the largest possible value of $|f(4) - f(1)|$?
- (2) What is the largest possible value of $|f(b) - f(a)|$ for a given interval $[a, b]$?
- (3) Suppose we also know that $f(1) = 10$. Find upper and lower bound for $f(4)$.

Solution:

(1)

15

(2)

$(b - a)f$

(3)

Upper: 25

Lower: -5
